We denote by $W_f = M / \sim$ the **quotient space**, which can be regarded as the space of connected components of fibers of f .

W_f is often called the **quotient space** or the **Reeb space** (or the **Reeb complex**) of f .

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

M, N : smooth ($= C^\infty$) manifolds

$f : M \rightarrow N$ a smooth map

For $x, x' \in M$, define $x \sim x'$ if

(i) $f(x) = f(x') (= y)$, and

(ii) x and x' belong to the same connected component of $f^{-1}(y)$.

Note that y may not be a regular value.

We denote by $W_f = M / \sim$ the **quotient space**, which can be regarded as the space of connected components of fibers of f .

W_f is often called the **quotient space** or the **Reeb space** (or the **Reeb complex**) of f .

We denote by $q_f : M \rightarrow W_f$ the **quotient map**.

Stein factorization

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

There exists a unique continuous map $\bar{f} : W_f \rightarrow N$ that makes the following diagram commutative:

$$\begin{array}{ccc} M & \xrightarrow{f} & N \\ q_f \searrow & & \nearrow \bar{f} \\ & W_f & \end{array}$$

Stein factorization

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

There exists a unique continuous map $\bar{f} : W_f \rightarrow N$ that makes the following diagram commutative:

$$\begin{array}{ccc} M & \xrightarrow{f} & N \\ & \searrow q_f & \nearrow \bar{f} \\ & W_f & \end{array}$$

The above diagram is called the **Stein factorization** of f .

Stein factorization

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

There exists a unique continuous map $\bar{f} : W_f \rightarrow N$ that makes the following diagram commutative:

$$\begin{array}{ccc} M & \xrightarrow{f} & N \\ & \searrow q_f & \nearrow \bar{f} \\ & W_f & \end{array}$$

The above diagram is called the **Stein factorization** of f .

Note that W_f is merely a topological space at this moment.

Stein factorization

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

There exists a unique continuous map $\bar{f} : W_f \rightarrow N$ that makes the following diagram commutative:

$$\begin{array}{ccc} M & \xrightarrow{f} & N \\ & \searrow q_f & \nearrow \bar{f} \\ & W_f & \end{array}$$

The above diagram is called the **Stein factorization** of f .

Note that W_f is merely a topological space at this moment.

Note also that each fiber of q_f corresponds to a connected component of a fiber of f .

Example

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

Triangulation of a map

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

Let $g : X \rightarrow Y$ be a continuous map between topological spaces. Then, g is said to be **triangulable** if there exist **simplicial complexes** K and L , a **simplicial map** $s : K \rightarrow L$, and **homeomorphisms** $\lambda : |K| \rightarrow X$ and $\mu : |L| \rightarrow Y$ such that the following diagram is commutative:

$$\begin{array}{ccc} X & \xrightarrow{g} & Y \\ \lambda \uparrow & & \uparrow \mu \\ |K| & \xrightarrow{|s|} & |L|, \end{array}$$

where $|K|$ and $|L|$ are polyhedrons associated with K and L , respectively, and $|s|$ is the continuous map associated with s .

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

Remark 1.1 The notion of the Stein factorization can be similarly defined for any continuous map $g : X \rightarrow Y$.

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

Remark 1.1 The notion of the Stein factorization can be similarly defined for any continuous map $g : X \rightarrow Y$.

Then, again the quotient space W_g is merely a topological space.

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

Remark 1.1 The notion of the Stein factorization can be similarly defined for any continuous map $g : X \rightarrow Y$.

Then, again the quotient space W_g is merely a topological space.

Today's first topic: If g is triangulable, then so is its Stein factorization?

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

Remark 1.1 The notion of the Stein factorization can be similarly defined for any continuous map $g : X \rightarrow Y$.

Then, again the quotient space W_g is merely a topological space.

Today's first topic: If g is triangulable, then so is its Stein factorization?

We will show that the answer is “Yes” under certain mild conditions.

§1. Introduction

Quotient space

Stein factorization

Example

Triangulation of a map

Today's topic

§2. Triangulation of Stein Factorization

§3. Application

Remark 1.1 The notion of the Stein factorization can be similarly defined for any continuous map $g : X \rightarrow Y$.

Then, again the quotient space W_g is merely a topological space.

Today's first topic: If g is triangulable, then so is its Stein factorization?

We will show that the answer is “Yes” under certain mild conditions.

In the second part, we will apply the result for studying components of regular fibers of generic smooth maps.

Remark

Problem

Let $s : K \rightarrow L$ be a triangulation of $f : M \rightarrow N$.

By Theorem 2.2, we have a **triangulation** of the **Stein factorization**:

$$\begin{array}{ccc}
 |K'| & \xrightarrow{|s'|} & |L'| \\
 | \varphi | \searrow & & \nearrow | \psi | \\
 & |V| &
 \end{array}
 \iff
 \begin{array}{ccc}
 M & \xrightarrow{f} & N \\
 q_f \searrow & & \nearrow \bar{f} \\
 & W_f &
 \end{array}$$

For each n -simplex $\sigma \in V$, define

$$\omega_\sigma := [| \varphi |^{-1}(b_\sigma)] \in \mathfrak{N}_{m-n},$$

where $b_\sigma \in \sigma$ is the barycenter of σ .

Problem

Proof of Lemma 3.3.

Let τ be an arbitrary $(n - 1)$ -simplex of V , and let $\sigma_1, \sigma_2, \dots, \sigma_r$ be the n -simplices of V containing τ as a face.

We have only to show

$$\sum_{j=1}^r \omega_{\sigma_j} = 0.$$

(The coefficient of τ in ∂c_f .)

Example 3

Remark

Problem

Thus, c_f defines a homology class $\gamma_f \in H_n(W_f; \mathfrak{N}_{m-n})$.

Since $\dim W_f = n$, we have

$$\gamma_f \neq 0 \iff c_f \neq 0$$

Furthermore, $c_f \neq 0$ iff there exists a component of a regular fiber which is not null-cobordant.

A homology class of W_f

Example 1

Example 2

Example 3

Remark

Problem

Thus, c_f defines a homology class $\gamma_f \in H_n(W_f; \mathfrak{N}_{m-n})$.

Since $\dim W_f = n$, we have

$$\gamma_f \neq 0 \iff c_f \neq 0$$

Furthermore, $c_f \neq 0$ iff there exists a component of a regular fiber which is not null-cobordant.

Therefore, if such a regular fiber component exists, we have $H_n(W_f; \mathbf{Z}_2) \neq 0$, since $\mathfrak{N}_{m-n} \cong \mathbf{Z}_2 \oplus \cdots \oplus \mathbf{Z}_2$.

The case of an oriented map can be treated similarly. □

Remark

Problem

Even if every component of every regular fiber is null-cobordant, the source manifold may not be null-cobordant.

For example, consider a stable map $f : \mathbb{C}P^2 \rightarrow \mathbb{R}^3$.

Every component of every regular fiber is diffeomorphic to S^1 , which is null-cobordant.

However, $\mathbb{C}P^2$ is not null-cobordant.

In fact, for a stable map $f : M^4 \rightarrow \mathbb{R}^3$, the cobordism class of M^4 is determined by **singular fibers**.
